1 Introduction

A simple guessing game but with dice. This can help those who do not have physical dice around but would like to play a game with chance. The game's simplicity can be played by people of all ages, as long as they can read and count. The game's visuals also help see the number of dice rolled.

2 Game Play and Rules

Start by running the game. The title of the game should appear along with a message about how to play the game. This will allow the players to know the rules and input their name. This will start the game by picking their numbered targets from 1-21.

```
Guessing game with dice
Pick your targeted amount
Proceed to roll as any dice to get your targeted amount
What is your name?
Dana
What number do you want to target to from 1-21?
```

Once entered, you are asked if you want to roll either one or two dice. After the input of how many rolls, a visual of how many dice were picked is shown and accounted for. It first tells you the total so far of your rolls and then tells you the difference between what you rolled and the targeted amount. This can help with knowing how much more is left and allow the player to think to roll either one or two more dice left.

```
What number do you want to target to from 1-21?
15
Do you want to roll 1 or 2 dice?
2
=====

|  •  |
|      •  |
|=====|
|  •  •  •  |
|  •  •  •  |
|=====|
You total amount so far is 8
The difference between what you rolled and your target number is: 7
Do you want to roll 1 or 2 dice?
```

Depending on how much you have left, it will continue to ask how many dice you would like to roll for the chance of winning. If rolled and your total is more than what you targeted, the difference would be in the negatives and would message you lost. If rolled and the total is what your target is, it will tell you, you won. After each game, it will ask if you would like to play

```

|           |
|  ●      ●  |
|           |
=====

You total amount so far is 16
The difference between what you rolled and your target number is: -1
You lost! Sorry Dana :(
Do you want to play again? y/n
█
```

This

```

Welcome to the game of doubles.
In order to win, you need to roll the dice and
obtain two of the same numbers, hence doubles.

```

1.2.0

With adding the game features to this version. Adding the number seed and input validation. It also asked how many dices you want to roll and the images. It has the option of entering 0 to end, but that does not work. It gave the total and difference of the amounts along with the message of winning and losing. It also asks if you want to play again. The problem with this version is that if you want to play again, and if you press yes, it asked for the targeted amount but then it bugs out and asks if you want to play again.

```
=====
| ●      ● |
| ●      ● |
| ●      ● |
|-----|
You total amount so far is 30
The difference between what you rolled and your target number is: -5
sucks to sucks
Do you want to play again? y/n
y
What number do you want to target to from 1-25?
2
Do you want to play again? y/n
[]
```

But if you don't want to play again, it thanks you for playing.

1.3.0

With this version, it kinda became like blackjack. This had a ton of errors in this version. Invalid input error after picking a number 1 -21 after the second round of playing. Asking if the user wants to play again after putting their targetted number amount. Remove '0' to exit since there was no way to exit without a bug. If you want to play again, it started to add from the previous game what the total sum was. After playing more, the losing message kept popping up but still ask for more rolls since you have not reached the targeted amount. After winning, it would ask how many dices to roll and then restart by asking the targetted amount.

```
What number do you want to target to from 1-21?
45
Invalid Input, Please enter a number from 1-21
45
Invalid Input, Please enter a number from 1-21
3
Do you want to play again? y/n
[]

-
What number do you want to target to from 1-21?
12
Do you want to play again? y/n
█
```

1.4.0

Fix looping and nesting. Added switch case for messaging. Fixed amount when restarting loop. Final version.

4 Pseudocode

initialize variables

calculate random time seed

display the objective of game

do

ask user for targeted amount

while target is over 21 or under 1

display invalid input, ask user for targeted amount again

while sum is less or equal to target

ask user how many rolls they want

while rolls does not equal 0

if rolls equal to 1

calculate random dice number of dice #1

if dice#1 is equal to one

display dice input

add increment sum of dice to total

if dice#1 is equal to two

display dice input

add increment sum of dice to total

if dice#1 is equal to three

display dice input

add increment sum of dice to total

if dice#1 is equal to four

display dice input

add increment sum of dice to total

if dice#1 is equal to five

display dice input

add increment sum of dice to total

if dice#1 is equal to six

display dice input

add increment sum of dice to total

if rolls equal to two

calculate random dice number of dice #1

calculate random dice number of dice #2

if dice#1 is equal to one

display dice input

add increment sum of dice to total

if dice#1 is equal to two

```
    display dice input
    add incremet sum of dice to total
if dice#1 is equal to three
    display dice input
    add incremet sum of dice to total
if dice#1 is equal to four
    display dice input
    add incremet sum of dice to total
if dice#1 is equal to five
    display dice input
    add incremet sum of dice to total
if dice#1 is equal to six
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to one
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to two
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to three
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to four
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to five
    display dice input
    add incremet sum of dice to total
if dice#2 is equal to six
    display dice input
    add incremet sum of dice to total
calculate difference of target and sum
display total amount
display difference
if sum is equal to target
    check 'w'
else if sum is greater than target
    check 'l'
switch check
```

```
        case 'w'
            display message you won
            break
        case 'l'
            display message you lost
            break
    display play again
    ask user input
    if yes
        again is true
    else if no
        again is false
        display thank you message
while again is not equal to false

return 0;
```
